Background:

The protein encoded by this gene is a member of the S100 family of proteins containing 2 EFhand calcium-binding motifs. S100 proteins are localized in the cytoplasm and/or nucleus of a wide range of cells; and involved in the regulation of a number of cellular processes such as cell cycle progression and differentiation. S100 genes include at least 13 members which are located as a cluster on chromosome 1q21. This protein may function in stimulation of Ca2+induced Ca2+ release; inhibition of microtubule assembly; and inhibition of protein kinase Cmediated phosphorylation. Reduced expression of this protein has been implicated in cardiomyopathies.

Synonyms:

S100; S100-alpha; S100A
