Background:	Heat shock protein 105 kDa?is a?protein?that in humans is encoded by the?HSPH1?gene. Prevents the aggregation of denatured proteins in cells under severe stress; on which the ATP levels decrease markedly. Inhibits HSPA8/HSC70 ATPase and chaperone activities. Highly expressed in testis. Present at lower levels in most brain regions; except cerebellum. Overexpressed in cancer cells. Phosphorylation on Ser-509 may be important for regulation of the HSPA8/HSC70 chaperone activity.
Synonyms:	HSP105; HSP105A; HSP105B; NY-CO-25
Protein Families:	Stem cell - Pluripotency
