Background:	PIWIL4 belongs to the Argonaute family of proteins; which function in development and maintenance of germline stem cells. It plays a central role during spermatogenesis by repressing transposable elements and prevent their mobilization; which is essential for the germline integrity. May be involved in the chromatin-modifying pathway by inducing 'Lys-9' methylation of histone H3 at some loci.
Synonyms:	HIWI2; MIWI2
Protein Pathways:	Dorso-ventral axis formation
