Background: The product of this gene belongs to the claudin family. It plays a major role in tight junction-specific obliteration of the intercellular space; through calcium-independent cell-adhesion activity. Defects in this gene are the cause of hypomagnesemia renal with ocular involvement (HOMGO). HOMGO is a progressive renal disease characterized by primary renal magnesium wasting with hypomagnesemia; hypercalciuria and nephrocalcinosis associated with severe ocular abnormalities such as bilateral chorioretinal scars; macular colobomata; significant myopia and nystagmus. Alternatively spliced transcript variants encoding distinct isoforms have been identified for this gene.

Synonyms: HOMG5

Protein Families: Transmembrane

Protein Pathways: Cell adhesion molecules (CAMs), Leukocyte transendothelial migration, Tight junction
