Gene Name: selenoprotein M Database Link: NP 536355 Entrez Gene 114679 MouseEntrez Gene 140606 Human Q8WWX9 **Background:** This gene encodes a selenoprotein; which contains a selenocysteine (Sec) residue at its active site. The selenocysteine is encoded by the UGA codon that normally signals translation termination. The 3' UTR of selenoprotein genes have a common stem-loop structure; the sec insertion sequence (SECIS); that is necessary for the recognition of UGA as a Sec codon rather than as a stop signal. This gene is expressed in a variety of tissues; and the protein is localized to the perinuclear structures.? Synonyms: SEPM
