Background: This gene encodes a selenoprotein; which contains a selenocysteine (Sec) residue at its active

site. The selenocysteine is encoded by the UGA codon that normally signals translation termination. The 3' UTR of selenoprotein genes have a common stem-loop structure; the sec insertion sequence (SECIS); that is necessary for the recognition of UGA as a Sec codon rather

than as a stop signal. This gene is expressed in a variety of tissues; and the protein is

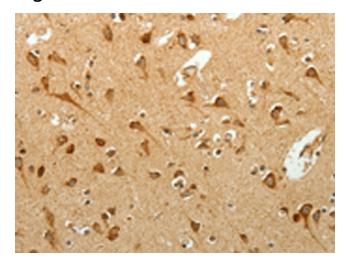

localized to the perinuclear structures.?

Synonyms: SEPM
