Background: TARSH gene expression is dramatically induced in mouse embryonic fibroblasts (MEFs)

replicative senescence and suppressed in human lung carcinoma specimens and thyroid carcinomas. The experiment observed that ABI3 expression is reduced or lost in most

carcinomas but also that there is a positive correlation between ABI3 and ABI3BP expression. And it express high levels in brain; heart; lung; liver; pancreas kidney and placenta.

Synonyms: NESHBP; TARSH

Protein Families: Druggable Genome, Transmembrane
