**Background:**

forkhead/winged helix transcription factor; Foxj3; which was expressed in embryonic and adult skeletal muscle. The 100-kb; 13-exon mouse Foxj3 gene on chromosome 4 encodes a 623 amino acid (aa) protein from an mRNA of at least 4.8 kb (Human FOXJ3: Chr 1; 627 aa; 5.3-kb mRNA). During the stages of mouse development investigated Foxj3 is expressed in neuroectoderm; in neural crest; and in many structures derived from neural crest cells; such as facioacoustic; trigeminal; and dorsal root ganglia. Stripes of expression appear at E10.5 in the location of myotomes and expand ventrally in a pattern similar to the developing body wall musculature. Developing limbs have a complex pattern of Foxj3 expression that at E12.5 colocalizes with the condensed mesenchyme of the skeletal primordia.
