**Background:** This gene encodes a small GTP-binding protein that belongs to the largest family within the Ras superfamily. Rab35 plays an important role in insulin-stimulated GLUT4 translocation in adipocytes. It is the target of TBC1D10A-C and that the intracellular accumulation of endosomal vesicles and impairs exosome secretion were occurred when inhibition of Rab35 function. The surface of oligodendroglia in a GTP-dependent manner was localized Rab35; it increases the density of vesicles; and may have a function in docking or tethering.

**Synonyms:** H-ray; RAB1C; RAY
