Background:	This gene encodes a telomere specific protein; TERF2; which is a component of the telomere nucleoprotein complex. This protein is present at telomeres in metaphase of the cell cycle; is a second negative regulator of telomere length and plays a key role in the protective activity of telomeres. While having similar telomere binding activity and domain organization; TERF2 differs from TERF1 in that its N terminus is basic rather than acidic.
Synonyms:	TRBF2; TRF2
Protein Families:	Transcription Factors
