Background:	This gene is a member of the small GTPase superfamily and encodes a lipid-anchored; cell membrane protein with five repeats of the RAS-related GTP-binding region. This protein is vital in regulation of growth and cell cycle progression due to its role in the insulin/TOR/S6K signaling pathway. The protein has GTPase activity and shuttles between a GDP-bound form and a GTP-bound form; and farnesylation of the protein is required for this activity. Three pseudogenes have been mapped; two on chromosome 10 and one on chromosome 22.
Synonyms:	RHEB2
