Background: Members of the trefoil family are characterized by having at least one copy of the trefoil

motif; a 40-amino acid domain that contains three conserved disulfides. They are stable secretory proteins expressed in gastrointestinal mucosa. Their functions are not defined; but they may protect the mucosa from insults; stabilize the mucus layer and affect healing of the epithelium. The encoded protein inhibits gastric acid secretion. This gene and two other

related trefoil family member genes are found in a cluster on chromosome 21.

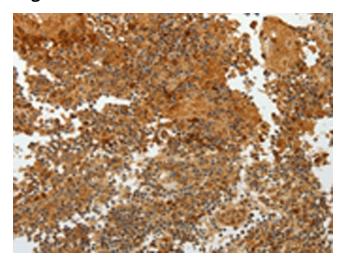

Synonyms: SML1; SP

Protein Families: Druggable Genome, Secreted Protein
