CRIGENE LRP2 Rabbit Polyclonal Antibody – TA322731

Background: The protein encoded by this gene; low density lipoprotein-related protein 2 (LRP2) or megalin; is a multi-ligand endocytic receptor that is expressed in many different tissues but primarily in absorptive epithilial tissues such as the kidney. This glycoprotein has a large aminoterminal extracellular domain; a single transmembrane domain; and a short carboxy-terminal cytoplasmic tail. The extracellular ligand-binding-domains bind diverse macromolecules including albumin; apolipoproteins B and E; and lipoprotein lipase. The LRP2 protein is critical for the reuptake of numerous ligands; including lipoproteins; sterols; vitamin-binding proteins; and hormones. This protein also has a role in cell-signaling; extracellular ligands include parathyroid horomones and the morphogen sonic hedgehog while cytosolic ligands include MAP kinase scaffold proteins and JNK interacting proteins. Recycling of this membrane receptor is regulated by phosphorylation of its cytoplasmic domain. Mutations in this gene cause Donnai-Barrow syndrome (DBS) and facio-oculoacoustico-renal syndrome (FOAR). DBS: GP330 Synonyms.
