Background:	The protein encoded by this gene is a cytokine receptor that belongs to the interleukin 1 receptor family. This receptor specifically binds interleukin 18 (IL18); and is essential for IL18 mediated signal transduction. IFN-alpha and IL12 are reported to induce the expression of this receptor in NK and T cells. This gene along with four other members of the interleukin 1 receptor family; including IL1R2; IL1R1; ILRL2 (IL-1Rrp2); and IL1RL1 (T1/ST2); form a gene cluster on chromosome 2q.
Synonyms:	CD218a; CDw218a; IL-1Rrp; IL1RRP; IL18RA
Protein Families:	Druggable Genome, Transmembrane
