Background:	This gene encodes a protein belonging to the 14-3-3 family of proteins; members of which mediate signal transduction by binding to phosphoserine-containing proteins. This highly conserved protein family is found in both plants and mammals. The encoded protein has been shown to interact with RAF1 and CDC25 phosphatases; suggesting that it may play a role in linking mitogenic signaling and the cell cycle machinery. Two transcript variants; which encode the same protein; have been identified for this gene.
Synonyms:	GW128; HEL-S-1; HS1; KCIP-1; YWHAA
