#### **DUSP6** Rabbit Polyclonal Antibody – TA323084

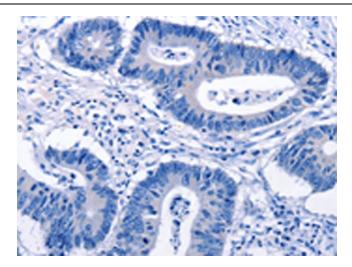

Background: The protein encoded by this gene is a member of the dual specificity protein phosphatase subfamily. These phosphatases inactivate their target kinases by dephosphorylating both the phosphoserine/threonine and phosphotyrosine residues. They negatively regulate members of the mitogen-activated protein (MAP) kinase superfamily (MAPK/ERK; SAPK/JNK; p38); which are associated with cellular proliferation and differentiation. Different members of the family of dual specificity phosphatases show distinct substrate specificities for various MAP kinases; different tissue distribution and subcellular localization; and different modes of inducibility of their expression by extracellular stimuli. This gene product inactivates ERK2; is expressed in a variety of tissues with the highest levels in heart and pancreas; and unlike most other members of this family; is localized in the cytoplasm. Two transcript variants encoding different isoforms have been found for this gene.?

Synonyms:	HH19; MKP3; PYST1
