Background: This gene encodes the alpha-1 chain of type II collagen; a fibrillar collagen found in cartilage and the vitreous humor of the eye. Mutations in this gene are associated with achondrogenesis; chondrodysplasia; early onset familial osteoarthritis; SED congenita; Langer-Saldino achondrogenesis; Kniest dysplasia; Stickler syndrome type I; and spondyloepimetaphyseal dysplasia Strudwick type. In addition; defects in processing chondrocalcin; a calcium binding protein that is the C-propeptide of this collagen molecule; are also associated with chondrodysplasia. There are two transcripts identified for this gene.

Synonyms: ANFH; AOM; COL11A3; SEDC; STL1

Protein Pathways: ECM-receptor interaction, Focal adhesion
