Background:

The protein encoded by this gene is a type 2 member of the phosphatidic acid phosphatase (PAP) family. All type 2 members of this protein family contain 6 transmembrane regions; and a consensus N-glycosylation site. PAPs convert phosphatidic acid to diacylglycerol; and function in de novo synthesis of glycerolipids as well as in receptor-activated signal transduction mediated by phospholipase D. Alternate transcriptional splice variants; encoding different isoforms; have been characterized.

PAP2; PAP2D; PRG5
