Background:	This gene encodes one of two non-identical subunits that constitute ribonucleoside-diphosphate reductase; an enzyme essential for the production of deoxyribonucleotides prior to DNA synthesis in S phase of dividing cells. It is one of several genes located in the imprinted gene domain of 11p15.5; an important tumor-suppressor gene region. Alterations in this region have been associated with the Beckwith-Wiedemann syndrome; Wilms tumor; rhabdomyosarcoma; adrenocortical carcinoma; and lung; ovarian; and breast cancer. This gene may play a role in malignancies and disease that involve this region.
Synonyms:	R1; RIR1; RR1
