**Background:**

This gene product is the main apolipoprotein of chylomicrons and low density lipoproteins. It occurs in plasma as two main isoforms; apoB-48 and apoB-100: the former is synthesized exclusively in the gut and the latter in the liver. The intestinal and the hepatic forms of apoB are encoded by a single gene from a single; very long mRNA. The two isoforms share a common N-terminal sequence. The shorter apoB-48 protein is produced after RNA editing of the apoB-100 transcript at residue 2180 (CAA->UAA); resulting in the creation of a stop codon; and early translation termination. Mutations in this gene or its regulatory region cause hypobetalipoproteinemia; normotriglyceridemic hypobetalipoproteinemia; and hypercholesterolemia due to ligand-defective apoB; diseases affecting plasma cholesterol and apoB levels.
