Background:	Heme oxygenase; an essential enzyme in heme catabolism; cleaves heme to form biliverdin; which is subsequently converted to bilirubin by biliverdin reductase; and carbon monoxide; a putative neurotransmitter. Heme oxygenase activity is induced by its substrate heme and by various nonheme substances. Heme oxygenase occurs as 2 isozymes; an inducible heme oxygenase-1 and a constitutive heme oxygenase-2. HMOX1 and HMOX2 belong to the heme oxygenase family. Alternative splice variants encoding the same protein have been identified at this locus.?
Synonyms:	HO-2
