Background:

The protein encoded by this gene is a member of the cyclin-dependent protein kinase (CDK) family. CDK family members are highly similar to the gene products of *Saccharomyces cerevisiae cdc28*; and *Schizosaccharomyces pombe cdc2*; and are known to be important regulators of cell cycle progression. This kinase is a catalytic subunit of the protein kinase complex that is important for cell cycle G1 phase progression and G1/S transition. The activity of this kinase first appears in mid-G1 phase; which is controlled by the regulatory subunits including D-type cyclins and members of INK4 family of CDK inhibitors. This kinase; as well as CDK4; has been shown to phosphorylate; and thus regulate the activity of; tumor suppressor protein Rb. Expression of this gene is up-regulated in some types of cancer. Multiple alternatively spliced variants; encoding the same protein; have been identified.
