Background:	This gene encodes a protein with multiple coiled coil motifs which is located in the nucleus; cytoplasm and mitochondria. The protein is involved in neurite outgrowth and cortical development through its interaction with other proteins. This gene is disrupted in a t(1;11) (q42.1;q14.3) translocation which segregates with schizophrenia and related psychiatric disorders in a large Scottish family. Alternate transcriptional splice variants; encoding different isoforms; have been characterized.
Synonyms:	C1orf136; SCZD9
