GRIGENE Caspase 12 (CASP12) Rabbit Polyclonal Antibody – TA324088S

Background:Caspases are cysteine proteases that cleave C-terminal aspartic acid residues on their
substrate molecules. This gene is most highly related to members of the ICE subfamily of
caspases that process inflammatory cytokines. In rodents; the homolog of this gene mediates
apoptosis in response to endoplasmic reticulum stress. However; in humans this gene
contains a polymorphism for the presence or absence of a premature stop codon. The
majority of human individuals have the premature stop codon and produce a truncated non-
functional protein. The read-through codon occurs primarily in individuals of African descent
and carriers have endotoxin hypo-responsiveness and an increased susceptibility to severe
sepsis. Several alternatively spliced transcript variants have been noted for this gene.

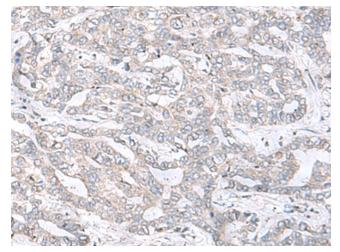

Synonyms:

CASP-12; CASP12P1
