Background:	Zinedin, which encodes a protein of 753aa, shares identical protein-protein interaction domains with striatin and SG2Na . They are all part of the striatin family, are multimodular, WD-repeat and calmodulinbinding proteins . All three proteins bind CaM in the presence of calcium suggesting that they play a role in or depend upon calcium signaling . They are all supposed to also function as scaffolding proteins, linking signaling and eukaryotic endocytosis .
Synonyms:	ZIN; zinedin
Note:	Detects ~95kDa.
