| Background:             | This gene encodes a 70kDa heat shock protein. In conjunction with other heat shock proteins,<br>this protein stabilizes existing proteins against aggregation and mediates the folding of newly<br>translated proteins in the cytosol and in organelles. The gene is located in the major<br>histocompatibility complex class III region, in a cluster with two closely related genes which<br>also encode isoforms of the 70kDa heat shock protein. |
| Synonyms:               | HSP70-1L; HSP70-HOM; HSP70T; hum70t  |
| Protein Pathways:       | Antigen processing and presentation, Endocytosis, MAPK signaling pathway, Spliceosome  |
