Background: This gene encodes a protein which is a member of the cysteine-aspartic acid protease

(caspase) family. Sequential activation of caspases plays a central role in the execution-phase

of cell apoptosis. Caspases exist as inactive proenzymes which undergo proteolytic processing at conserved aspartic residues to produce 2 subunits, large and small, that

dimerize to form the active enzyme.

Synonyms: CPP32; CPP32B; SCA-1

Note: Caspase 3 (p17,Cleaved-Asp175) Antibody detects endogenous levels of fragment of activated

Caspase 3 resulting from cleavage adjacent to Asp175.
