IHC of human pancreas infiltrating ductal adenocarcinoma tissue. The recommended concentration is 1.0 ug/ml - 2.0 ug/ml with an overnight incubation at 4C. An HRP-labeled polymer detection system was used with an alcohol-soluble AEC chromogen. Optimal results for these conditions were achieved with heat induced antigen retrieval with a pH 6.0 Sodium Citrate buffer or enzyme induced antigen retrieval with proteinase K at room temperature. Optimal concentrations and conditions may vary.
