**Background:** SOX18 is a member of the SOX (SRY-related HMG-box) family of transcription factors involved

in the regulation of embryonic development and in the determination of the cell fate. The encoded protein may act as a transcriptional regulator after forming a protein complex with

other proteins. This protein plays a role in hair, blood vessel, and lymphatic vessel development. Mutations in this gene have been associated with recessive and dominant

forms of hypotrichosis-lymphedema-telangiectasia.
