GRIGENE Kallikrein 7 (KLK7) Rabbit Polyclonal Antibody – TA332734S

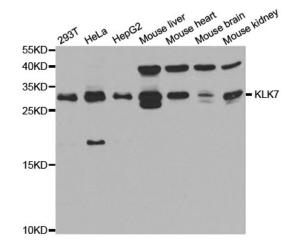

Background:This gene encodes a member of the kallikrein subfamily of serine proteases. These enzymes
have diverse physiological functions and many kallikrein genes are biomarkers for cancer.
The encoded protein has chymotrypsin-like activity and plays a role in the proteolysis of
intercellular cohesive structures that precedes desquamation, the shedding of the outermost
layer of the epidermis. The encoded protein may play a role in cancer invasion and
metastasis, and increased expression of this gene is associated with unfavorable prognosis
and progression of several types of cancer. Polymorphisms in this gene may play a role in the
development of atopic dermatitis. Alternatively spliced transcript variants encoding multiple
isoforms have been observed for this gene, which is one of fifteen kallikrein subfamily
members located in a gene cluster on chromosome 19.

Synonyms: hK7; PRSS6; SCCE
