GRIGENE DYNLL1 Rabbit Polyclonal Antibody – TA332878S

Background:Cytoplasmic dyneins are large enzyme complexes with a molecular mass of about 1,200 kD.
They contain two force-producing heads formed primarily from dynein heavy chains, and
stalks linking the heads to a basal domain, which contains a varying number of accessory
intermediate chains. The complex is involved in intracellular transport and motility. The
protein described in this record is a light chain and exists as part of this complex but also
physically interacts with and inhibits the activity of neuronal nitric oxide synthase. Binding of
this protein destabilizes the neuronal nitric oxide synthase dimer, a conformation necessary
for activity, and it may regulate numerous biologic processes through its effects on nitric
oxide synthase activity. Alternate transcriptional splice variants have been characterized.

Synonyms: DLC1; DLC8; DNCL1; DNCLC1; hdlc1; LC8; LC8a; PIN
