Background:	ANKRD11 is a member of a novel family of ankyrin repeats containing cofactors (ANCOs) that interact with p160 coactivators to inhibit ligand-dependent transactivation. ANKRD11 encodes a large nuclear protein with five ankyrin repeats, and parts of its sequences have been reported as nasopharyngeal carcinoma susceptibility protein and medulloblastoma antigen. This gene also colocalizes and interacts with histone deacetylases.
Synonyms:	ANCO-1; ANCO1; LZ16; T13
