Background:	TRIM34 is a member of the tripartite motif (TRIM) family. The TRIM motif includes three zinc-binding domains, a RING, a B-box type 1 and a B-box type 2, and a coiled-coil region. Expression of this gene is up-regulated by interferon. This gene is mapped to chromosome 11p15, where it resides within a TRIM gene cluster. Alternate splicing of this gene generates four transcript variants. Additionally, a read-through transcript transcribed from this gene and TRIM6 has been observed.
