Background: This gene is a member of the septin family of GTPases. Members of this family are required

for cytokinesis. One version of pediatric acute myeloid leukemia is the result of a reciprocal translocation between chromosomes 11 and X, with the breakpoint associated with the genes

encoding the mixed-lineage leukemia and septin 2 proteins. This gene encodes four

transcript variants encoding three distinct isoforms. An additional transcript variant has been identified, but its biological validity has not been determined. [provided by RefSeq, Jul 2008]
