GRIGENE DPH2 Rabbit Polyclonal Antibody – TA340019

Background:This gene is one of two human genes similar to the yeast gene dph2. The yeast gene was
identified by its ability to complement a diphthamide mutant strain, and thus probably
functions in diphthamide biosynthesis. Diphthamide is a post-translationally modified
histidine residue present in elongation factor 2 (EF2) that is the target of diphtheria toxin
ADP-ribosylation. This gene is one of two human genes similar to the yeast gene dph2. The

for this gene.
