**Background:**

TCEAL8 is a member of The transcription elongation factor A (SII)-like (TCEAL) gene family. Members of This family contain TFA domains and may function as nuclear phosphoproteins that modulate transcription in a promoter context-dependent manner. This gene encodes a member of The transcription elongation factor A (SII)-like (TCEAL) gene family. Members of This family contain TFA domains and may function as nuclear phosphoproteins that modulate transcription in a promoter context-dependent manner. Multiple family members are located on The X chromosome. Alternative splicing results in multiple transcript variants encoding a single isoform.
