Background:	This gene encodes a trypsinogen, which is a member ofThe trypsin family of serine proteases.This enzyme is expressed inThe brain and pancreas and is resistant to common trypsin inhibitors. It is active on peptide linkages involvingThe carboxyl group of lysine or arginine.This gene is localized toThe locus of T cell receptor beta variable orphans on chromosome 9. Four transcript variants encoding different isoforms have been described forThis gene. [provided by RefSeq, Oct 2010]
