| Background:             | This gene encodes a member of the aldo/keto reductase superfamily, which consists of more<br>than 40 known enzymes and proteins. These enzymes catalyze the conversion of aldehydes<br>and ketones to their corresponding alcohols by utilizing NADH and/or NADPH as cofactors.<br>The enzymes display overlapping but distinct substrate specificity. This enzyme catalyzes the<br>reaction of progesterone to the inactive form 20-alpha-hydroxy-progesterone. This gene<br>shares high sequence identity with three other gene members and is clustered with those<br>three genes at chromosome 10p15-p14. |
