Background: CORO1A is a novel actin-binding protein with a WD repeat and a leucine zipper motif.

CORO1A forms homodimers, that the association is mediated by the leucine zipper structure

in the C-terminal region, and that it plays a role in the cross-linking of F-actin in the cell. The

leukocyte plasma membrane associates with the actin cytoskeleton through CORO1A.Downregulation of CORO1A gene transcription restricts entry/survival of

mycobacteria within macrophages
