Entrez Gene 5276 Human

<u>O75830</u>

Background: The gene encodes a member of a family of proteins that acts as inhibitors of serine

proteases. These proteins function in the regulation of a variety of physiological processes, including coagulation, fibrinolysis, development, malignancy, and inflammation. Expression of the encoded protein may be downregulated during pancreatic carcinogenesis. Alternative splicing results in multiple transcript variants for this gene. [provided by RefSeq, Jan 2013]
