	Syntenin (SDCBP) Mouse Monoclonal Antibody [Clone ID: 3D9-G9-H4] – TA347044
Background:	The protein encoded by this gene was initially identified as a molecule linking syndecan- mediated signaling to the cytoskeleton. The syntenin protein contains tandemly repeated PDZ domains that bind the cytoplasmic, C-terminal domains of a variety of transmembrane proteins. This protein may also affect cytoskeletal-membrane organization, cell adhesion, protein trafficking, and the activation of transcription factors. The protein is primarily localized to membrane-associated adherens junctions and focal adhesions but is also found at the endoplasmic reticulum and nucleus. Alternative splicing results in multiple transcript variants encoding different isoforms.
Synonyms:	MDA-9; MDA9; ST1; SYCL; TACIP18
Protein Families	: Druggable Genome, Transmembrane
