### ZAP70 Mouse Monoclonal Antibody [Clone ID: 4B2-C1-H3] - TA347075M

**Background:** This gene encodes an enzyme belonging to the protein tyrosine kinase family, and it plays a

role in T-cell development and lymphocyte activation. This enzyme, which is phosphorylated on tyrosine residues upon T-cell antigen receptor (TCR) stimulation, functions in the initial step of TCR-mediated signal transduction in combination with the Src family kinases, Lck and Fyn. This enzyme is also essential for thymocyte development. Mutations in this gene cause selective T-cell defect, a severe combined immunodeficiency disease characterized by a selective absence of CD8-positive T-cells. Two transcript variants that encode different

isoforms have been found for this gene. [provided by RefSeq, Jul 2008]
