Background:	SETD8 (UniProtKB/Swiss-Prot entry Q9NQR1) is a histone methyl transferase that specifically monomethylates 'Lys-20' of histone H4. This histone modification represents a specific tag for epigenetic transcriptional repression and is enriched during mitosis. SETD8 may also play a role in maintaining silent chromatin by preventing the acetylation of the H4 tail.
Synonyms:	PR-Set7; SET07; SET8; SETD8
Protein Families:	Druggable Genome
Protein Pathways:	Lysine degradation
