Background:	This gene encodes a member of an adapter protein family that binds to several tyrosine- phosphorylated proteins. The product of this gene has several SH2 and SH3 domains (src- homology domains) and is involved in several signaling pathways, recruiting cytoplasmic proteins in the vicinity of tyrosine kinase through SH2-phosphotyrosine interaction. The N- terminal SH2 domain of this protein functions as a positive regulator of transformation whereas the C-terminal SH3 domain functions as a negative regulator of transformation. Two alternative transcripts encoding different isoforms with distinct biological activity have been described.
