**Background:** Ephrin receptors and their ligands, the ephrins, mediate numerous developmental processes,

particularly in the nervous system. Based on their structures and sequence relationships, ephrins are divided into the ephrin-A (EFNA) class, which are anchored to the membrane by a

glycosylphosphatidylinositol linkage, and the ephrin-B (EFNB) class, which are

transmembrane proteins. The Eph family of receptors are divided into two groups based on the similarity of their extracellular domain sequences and their affinities for binding ephrin-A and ephrin-B ligands. Ephrin receptors make up the largest subgroup of the receptor tyrosine

kinase (RTK) family. This gene encodes a receptor for ephrin-B family members.

**Synonyms:** EK2; ETK2; HEK2; TYRO6
