Background: The protein encoded by this gene is a member of the NR1 subfamily of nuclear hormone receptors. It can bind as a monomer or as a homodimer to hormone response elements upstream of several genes to enhance the expression of those genes. The encoded protein has been shown to interact with NM23-2, a nucleoside diphosphate kinase involved in organogenesis and differentiation, as well as with NM23-1, the product of a tumor metastasis suppressor candidate gene. Also, it has been shown to aid in the transcriptional regulation of some genes involved in circadian rhythm.

Synonyms: NR1F1; ROR1; ROR2; ROR3; RZR-ALPHA; RZRA

Protein Families: Druggable Genome, Nuclear Hormone Receptor, Transcription Factors
