Background: E2F2 belongs to E2F family of transcription factors. The E2F family plays a crucial role in the

control of cell cycle and action of tumor suppressor proteins, and is also a target of the transforming proteins of small DNA tumor viruses. The E2F proteins contain several evolutionally conserved domains found in most members of the family. These domains include a DNA binding domain, a dimerization domain which determines interaction with the differentiation regulated transcription factor proteins (DP), a transactivation domain enriched

in acidic amino acids, and a tumor suppressor protein association domain which is

embedded within the transactivation domain. This protein and another 2 members, E2F1 and

E2F3, have an additional cyclin binding domain. This protein binds specifically to

retinoblastoma protein pRB in a cell-cycle dependent manner, and it exhibits overall 46%

amino acid identity to E2F1.
