|------------------|--|
| Background:      | HTRA4 is a member of the HtrA family of proteases. The protein contains a putative signal<br>peptide, an insulin growth factor binding domain, a Kazal protease inhibitor domain, a<br>conserved trypsin domain and a PDZ domain. Based on studies on other related family<br>members, this enzyme may function as a secreted oligomeric chaperone protease to degrade<br>misfolded secretory proteins. Other human HtrA proteins have been implicated in arthritis,<br>tumor suppression, unfolded stress response, apoptosis, and aging. |
| Synonyms:        | FLJ90724   |
| Protein Families | : Druggable Genome, Protease, Transmembrane  |
