Background:	Endothelin (ET-1) is a 21 amino acid peptide, also known as preproendothelin-1 (PPET1), that is produced by the vascular endothelium from a 39 amino acid precursor, big ET-1, through the actions of an endothelin converting enzyme (ECE) found on the endothelial cell membrane. ET-1 is involved in regulation of cardiovascular functions where it has been implicated in the pathogenesis of hypertension, coronary vasospasm, and heart failure. It is also known to causes fibrosis of the vascular cells as well as to stimulate production of reactive oxygen species. This antibody was generated by immunization of rabbits with Endothelin-1 coupled to a carrier protein.
