Background:	Glucagon-Like Peptide-1 (GLP-1) (7-37) is an incretin hormone that causes glucose dependent release of insulin by pancreatic beta cells. It derives from the proteolytic cleavage of proglucagon, which gives rise to two biologically active forms, GLP-1 (7- 36) and GLP-1 (7-37). Both play roles in gastric motility on the suppression of plasma glucagon levels and promote the stimulation of glucose disposal in peripheral tissues independent of the actions of insulin. This antibody was generated by immunization of rabbits with GLP-1 (7-37) coupled to a carrier protein.
Synonyms:	GLP1; GLP2; glucagon; GRPP
